# Plugins

- phpList plugins

# phpList plugins

Your phpList can be extended, adapted and customized by the use of plugins.

You can:

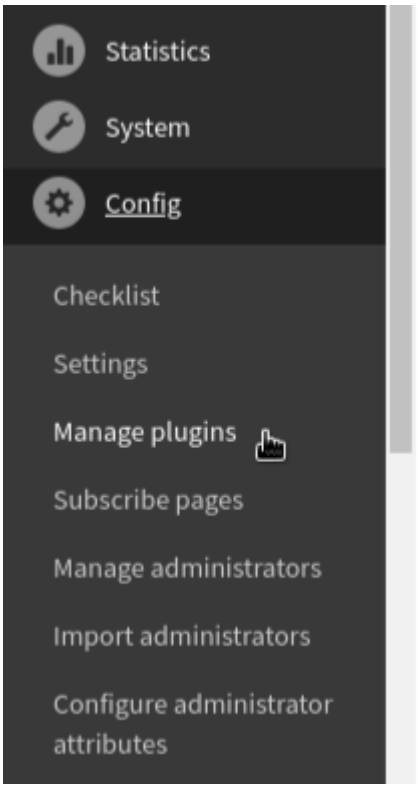

- Use plugins from the **phpList plugin library**, which are developed by the phpList community
- Develop your own plugin, or pay a developer to build it for you
- Contribute your plugin back into the plugin library.

This chapter will show you how to install, enable/disable and delete a plugin.

In the example used, we will change the choice of editor used in our install by installing the CKEditorPlugin and disabling the fckphplist plugin.

# The plugins page

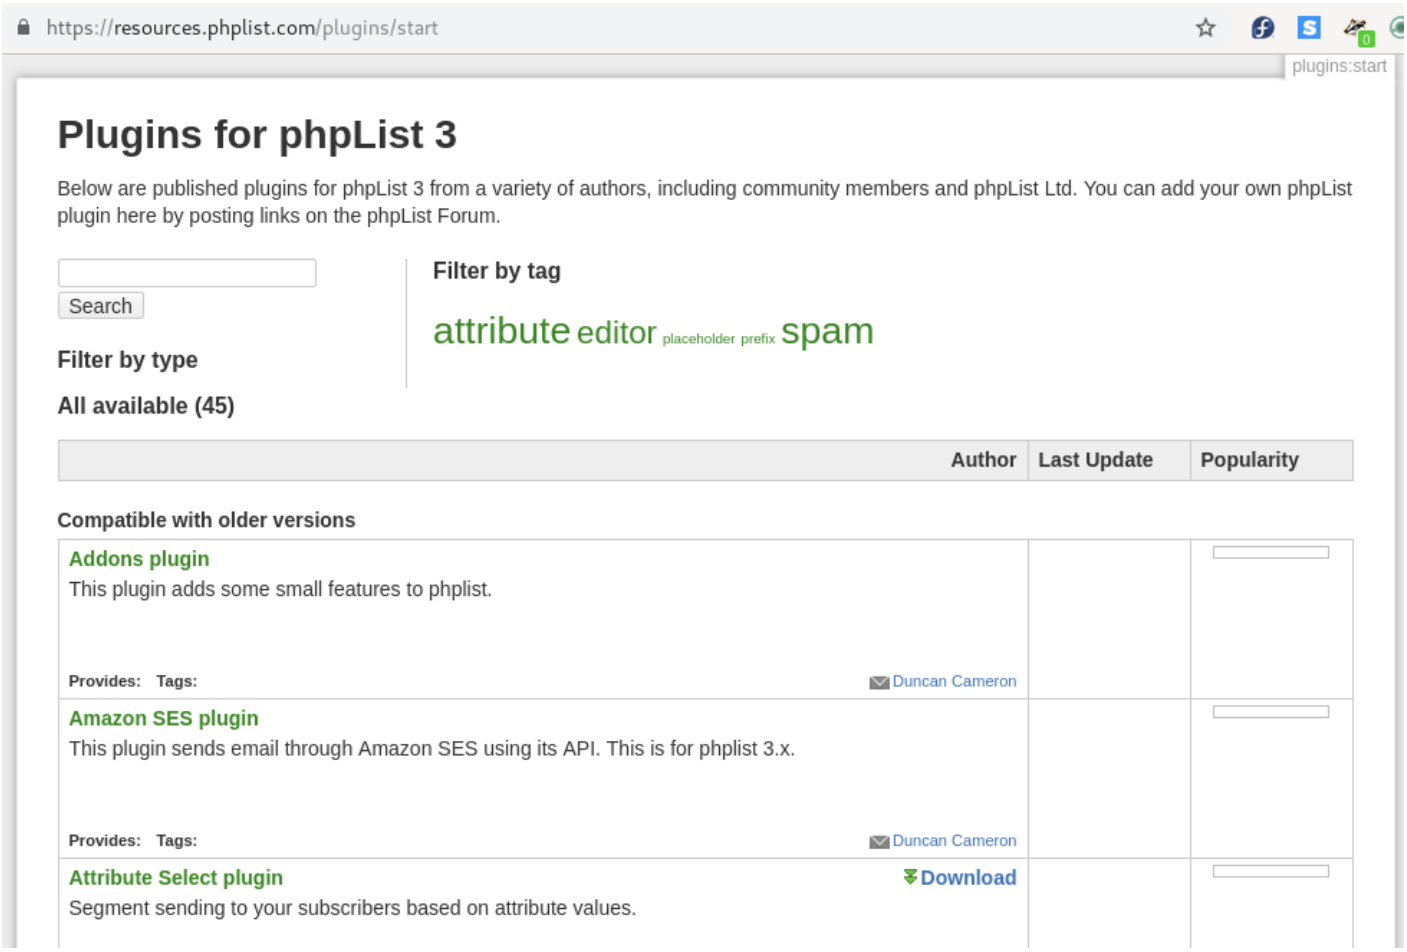

To get to the plugins page from the main menu, click **Config** > **Manage plugins**.

You will see a list of the plugins you currently have installed. To find a new plugin, click the **Find plugins** link.

The plugin library will then open in a new page. You can access the Plugin library at https://resources.phplist.com/plugins/start

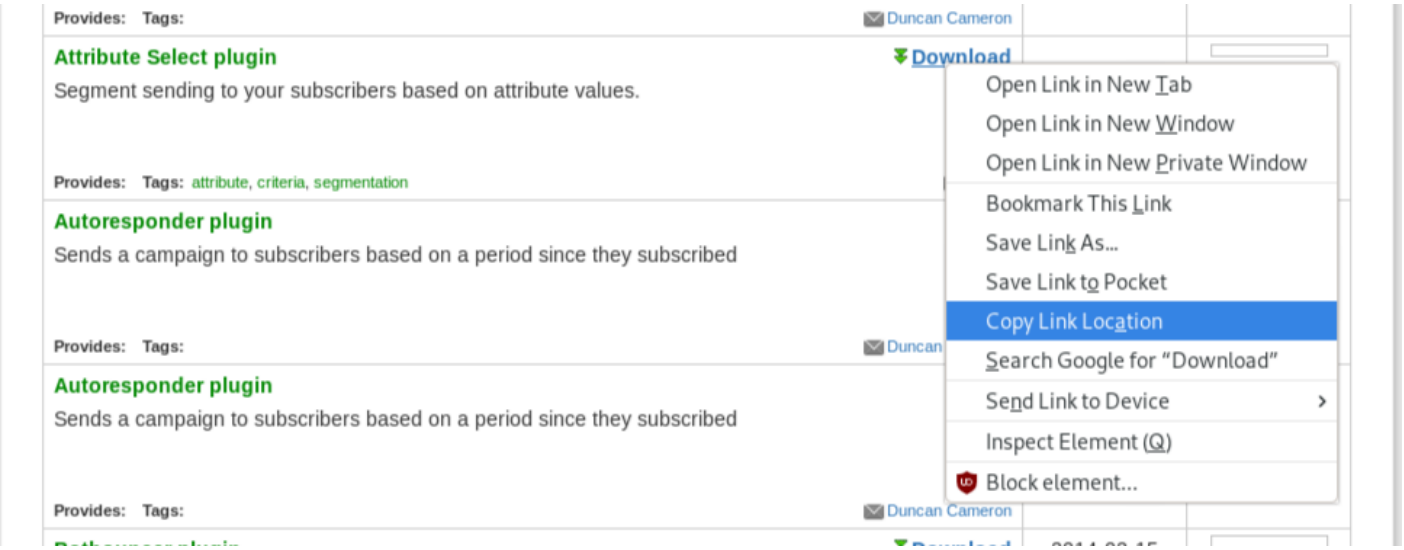

# Getting the plugin URL from the plugin library

Once you have clicked the **Find plugins** link, you will see the plugin library. Scroll down or search to find the desired plugin.

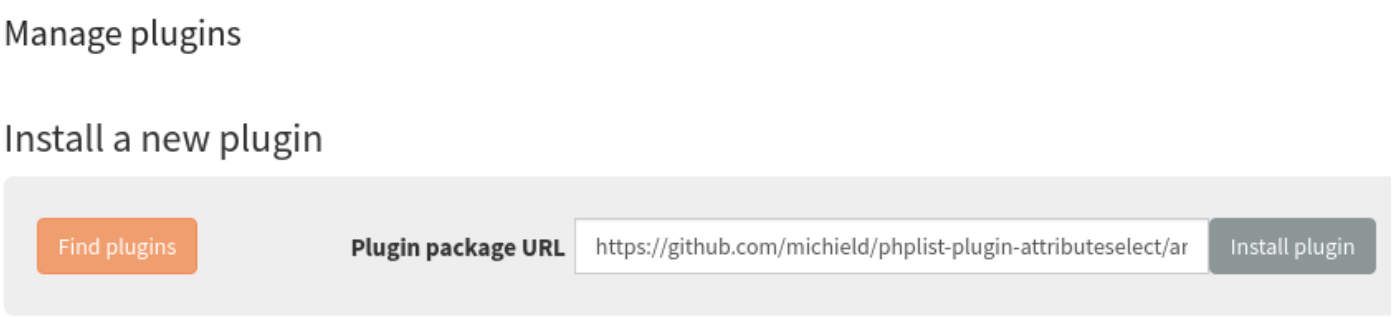

In this example, we are installing the "Attribute Select Plugin".

Right click on the **Download** link and choose the option to copy the URL. The wording of this option will depend on your browser: in this case it reads **Copy Link Location**.

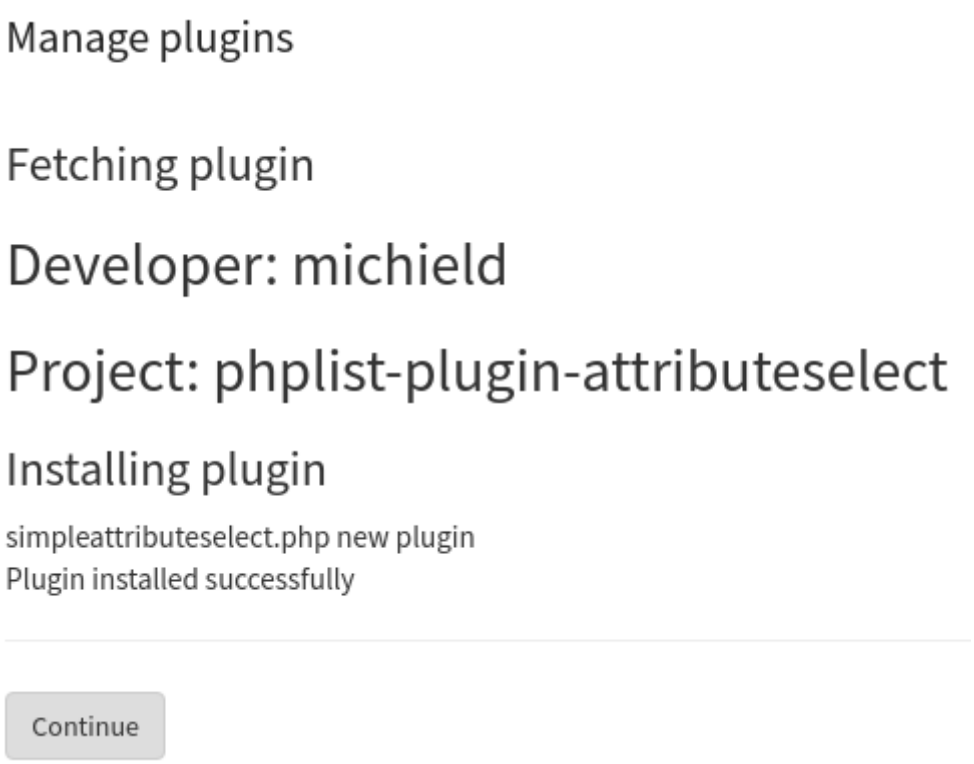

# Installing the plugin

Return to your phpList (it should be in the browser tab to the left of the plugin library). Paste the url into the box labelled **Plugin package URL** and click the **Install plugin** below.

You will see the plugin install. Click **Continue.**

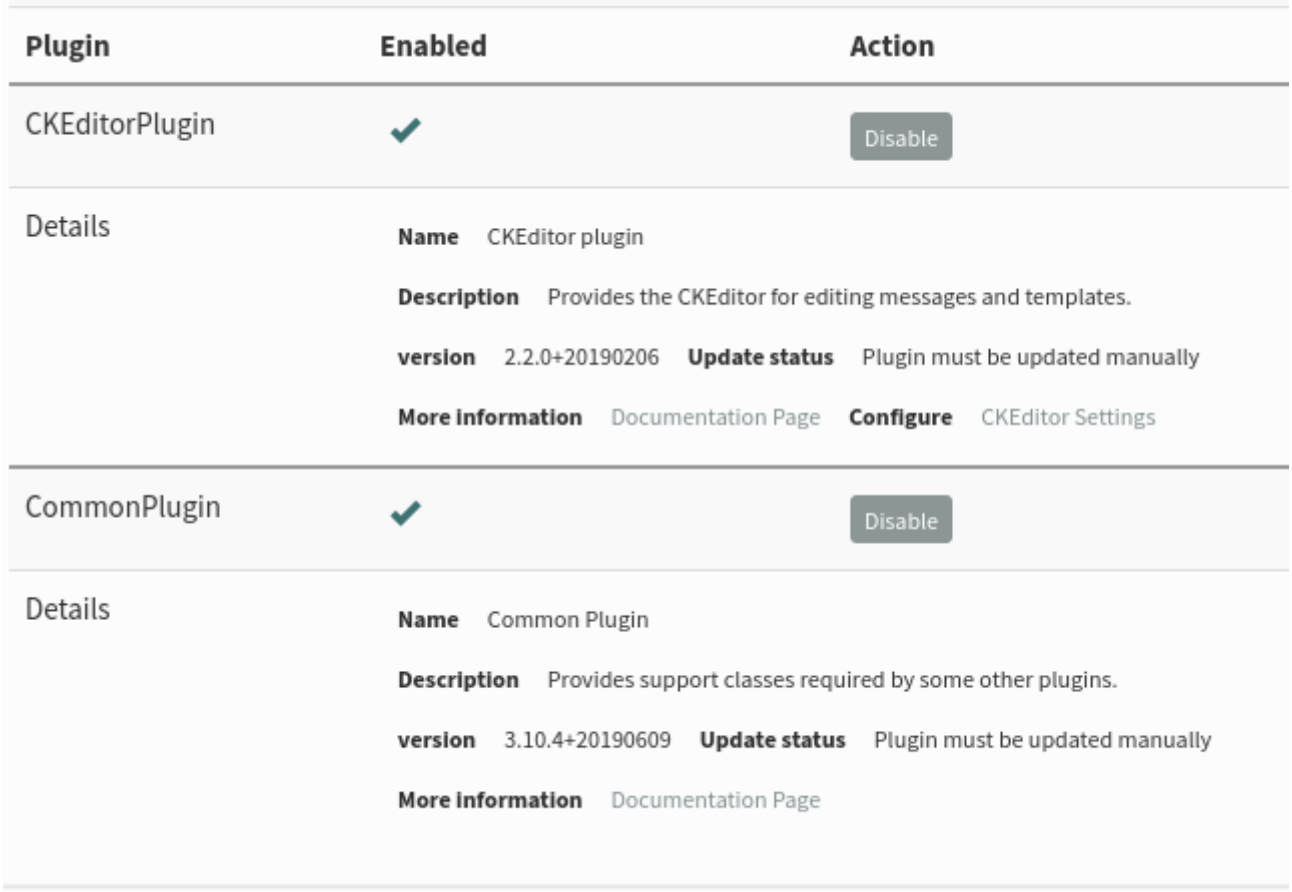

# Turning plugins on and off

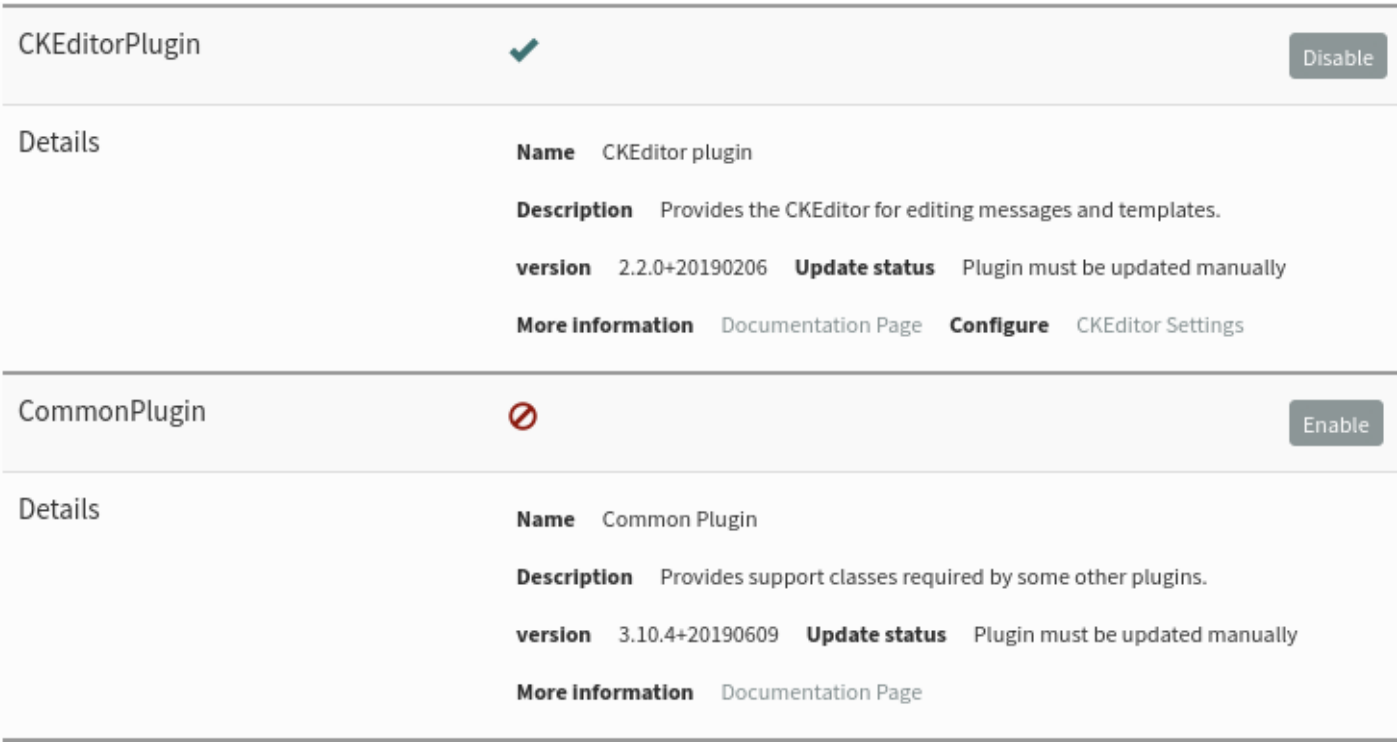

Once you are on the plugins page, either from **Config** > **Manage plugins** on the main menu, or after installing a plugin and clicking **Continue**, you can turn plugins on or off.

A green tick icon indicates that the plugin is enabled (on), and a red round icon indicates that the plugin is disabled (off).

To disable (turn off) a plugin, click on the "Disable" button on your right.

This will now turn red: the plugin is now disabled.
